

William Joseph Maddock

SOFTWARE ENGINEER | FULL-STACK, CLOUD & AI APPLICATIONS

Denver Metro Area, CO | (720) 839-3238 | willzaeagle@gmail.com

linkedin.com/in/willmaddockcs | github.com/willmaddock | [Portfolio](#) | [Cosmic Universalism](#)

Professional Summary

Software engineer and founder with a B.S. in Computer Science and experience delivering tested public web applications, browser-based AI tools, backend systems, mobile applications, desktop applications, and data-analysis pipelines. Founded and currently leads the Cosmic Universalism Computational Intelligence Initiative (CUCII), directing product architecture, implementation, testing, documentation, and release workflows, and independently shipped JobTracker Hub, a full-stack Python/FastAPI and React desktop application with a 48-test automated suite and packaged macOS releases. Technical background includes Astro, TypeScript, JavaScript, Python, FastAPI, Ruby on Rails, Kotlin, Rust, GitHub Actions, cloud services, accessibility, and Agile team leadership.

Professional Experience

Cosmic Universalism Computational Intelligence Initiative (CUCII)

Dec 2024–Present

Founder & Lead Developer

Remote

Website: [Cosmic Universalism](#) | CUCII: [Prompt Studio](#) | Repository: [GitHub](#)

- Founded and currently leads an open-source philosophical and computational initiative exploring AI-facing applications, consciousness, time, structured conversation design, and evidence-aware publishing.
- Designed and launched an Astro/TypeScript static website with eight production routes, including CUCII, CU-Time, the Cosmic Breath Explorer, framework, research, media, and project information.
- Built the CUCII Prompt Studio as a deterministic browser-based prompt system with typed platform, preset, conversation, source, and working-context registries.
- Implemented configuration validation, normalization, prompt assembly, copy/download workflows, and TXT/Markdown exports without requiring a backend, database, account, or API.
- Developed accessible interactive systems including a typed 51-state Cosmic Breath engine, guarded transitions, drag/snap controls, adaptive visual atmosphere, educational layers, and empirical-context separation.
- Established a verified quality gate of 251 automated tests across 30 files; completed a successful Astro production build with no warnings or errors and generated eight static pages.
- Manage technical architecture, documentation, source provenance, feature branches, review checkpoints, release tags, GitHub workflows, and cross-platform AI testing.

Technology: Astro, TypeScript, JavaScript, semantic HTML, modern CSS, Markdown, SVG, Vitest, Git, GitHub Actions, GitHub Pages, LaTeX

Amazon

Summer 2023–Present

Flex Driver & Warehouse Associate (DDE9)

Denver, CO

- Deliver 30–35 packages per shift across 3-hour routes with a consistent on-time completion record, earning 10+ customer compliments for service quality.
- Use Linux-based operational workflows and Bash-related troubleshooting practices when resolving process and system issues.
- Collaborate with associates and operations teams to identify blockers and maintain safe, efficient throughput.

Selected Technical Projects

JobTracker Hub

Aug 2026–Present

Founder & Developer | Python, FastAPI, SQLite, React, PyInstaller

Repository: [GitHub](#)

- Designed and built a full-stack, privacy-first job-search dashboard: a Python/FastAPI REST backend with SQLite persistence and a React frontend delivering pipeline tracking, drag-and-drop Kanban, and full-text search over local application documents.
- Engineered a filesystem indexing/classification engine with configurable rules and duplicate detection, and hardened file-serving endpoints with path-traversal and symlink protections, keeping all data local with no cloud or account required.
- Authored a 48-test pytest suite covering workspace management, file-serving security, and import/export integrity; packaged the app as a native macOS desktop build with PyInstaller and pywebview, publishing signed .dmg releases via GitHub Releases.
- Added Insights analytics (response rate, interview rate, time-to-response) with Chart.js visualizations and a keyboard-driven command palette; personal daily use across 110+ tracked applications shows an 81% response rate and 7% interview rate, well above the published 2–10% and 2–3% industry benchmarks.

Technology: Python, FastAPI, Pydantic, SQLite, React, JavaScript, pytest, PyInstaller, Chart.js, GitHub Releases
Secure Access Management System Sep 2024–Dec 2024
Founder & Lead Developer | Ruby on Rails, RBAC, Google Cloud Storage

- Built a Ruby on Rails application with role-based access control, security-clearance workflows, protected resources, and permission-aware navigation.
- Integrated Google Cloud Storage for persistent uploads and designed account, authorization, and file-management flows.
- Applied secure-development, access-control, and validation practices throughout the application.

Selected Technical Projects (continued)

SpaceX Launch Analysis May 2025–Jul 2025
Data Scientist | Python, Pandas, scikit-learn, Plotly Dash, Folium

- Built an end-to-end data pipeline covering API collection, web-derived data, cleaning, exploratory analysis, feature preparation, model training, and evaluation.
- Developed interactive Plotly Dash and Folium visualizations for launch sites, outcomes, payloads, and geographic patterns.
- Completed the project as the capstone for the IBM Data Science Professional Certificate.

Auraria Mobile Parking (AMP) Aug 2024–Dec 2024
Technical Lead | Kotlin, Android Studio, APIs, Git, ClickUp

- Led a six-person team developing a Kotlin Android application for campus parking.
- Coordinated architecture, task planning, integration, Git workflows, and Agile delivery using ClickUp.
- Integrated real-time parking availability and weather information into the mobile experience.

Additional Projects

Personal Portfolio Site Aug 2025–Present
Developer | Hugo, PaperMod, HTML/CSS, GitHub Actions

- Developed a responsive portfolio with custom navigation, search, embedded media, and SEO-oriented content, with automated GitHub Actions deployment.

Cosmic Breath Time Converter 2025–Present
Developer | HTML, JavaScript, calendar conversion, validation

- Maintained an accessible forward/reverse time-conversion interface with separated constants, calendar logic, validation, and documented boundaries between converter mathematics and CU structural models.

Technical Skills

Languages: TypeScript, JavaScript, Python, Ruby, Kotlin, Rust, Java, SQL, Go
Web/Application: Astro, Ruby on Rails, FastAPI, React, semantic HTML, modern CSS, Markdown, SVG, Android Studio, Bootstrap
Data/Testing: Pandas, scikit-learn, Plotly Dash, Folium, Pydantic, SQLite, Vitest, pytest, unit and regression testing, validation
Cloud/DevOps: Git, GitHub, GitHub Actions, GitHub Pages, GitHub Releases, Docker, Kubernetes, AWS services and AWS Educate environments, Google Cloud Storage, PyInstaller, pywebview
Engineering: Full-stack development, backend systems, REST API design, static-site architecture, prompt systems, RBAC, data pipelines, desktop application packaging, accessibility, source provenance, release governance, Agile/FDD leadership

Education

Bachelor of Science in Computer Science Aug 2022–May 2025
Metropolitan State University of Denver Denver, CO
GPA: 3.13/4.0
Relevant Coursework: Cloud Computing; Web and Mobile Development; Algorithms; Data Science and Machine Learning

Certifications & Credentials

IBM Data Science Professional Certificate, Coursera (2025) | Rust Programming Specialization, Coursera (2025) | AWS Generative AI Badge | AWS Machine Learning Foundations | 11 AWS Educate badges
